

My proposal

I propose a new kind of digital structure for publishing and communicating where *people get the limitations of their speaking, and so get interested in developing their listening*

This structure provides a topology where (whatever the topic) *what’s most inclusive & relevant floats to the top.*

Example of possible interaction experience

(from Kialo.com)

When citizens can better afford to spend time studying, overall levels of education grow and the workforce becomes more skilled. This would increase the quality and pay of jobs in general.

Pros

- Increased levels of education are good for the economy, as educated workers are more likely to innovate.
- A UBI guaranteed to any citizen of a said country would allow students to focus way more on their studies than on the need of earning money, thus allowing them to optimize the intellectual benefit of their learning years, to become more educated individuals, and also more capable and productive workers once they are done with their studies. Increases in return their chance to...

Cons

- If an entire population is highly educated then it is no longer a defining feature for any individual worker. As a result it would only increase the baseline level of skills required for all jobs; leading to people doing the same work for the same money regardless of the fact that they have pursued higher education.
- Growing education levels do not necessarily increase social mobility, especially for people belonging to traditionally oppressed groups. For example, many university graduates with bachelor degrees are unable...

Imagine a market with the tools & skilled facilitation empowering participants to discover their shared humanity, building bridges to action that works for everyone.

Let’s create a world where everyone has the experience of being heard about what’s important to them.
